4							-

- total: This column represents the total number of accidents in a given region.
- speeding: This column represent the percentage of accidents related to speeding in the region.
- alcohol: This column represent the percentage of accidents related to alcohol consumption.
- not_distracted: This column represent the percentage of accidents where the driver was not distracted.
- · no_previous: This column represent the percentage of accidents involving drivers with no previous accidents.
- ins_premium: This column represents the insurance premium (cost) in that region.
- ins_losses: This column represent the insurance losses (claims) in that region.
- abbrev: This column represent the abbreviation of the state or region to which the data corresponds.

dtype: bool			

plt.scatter(df.speeding,df.alcohol)

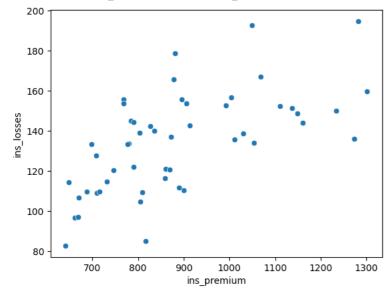

<matplotlib.collections.PathCollection at 0x7b2846366d70>

Shows a positive correlation

sns.scatterplot(x="ins_premium",y="ins_losses",data=df)

<Axes: xlabel='ins_premium', ylabel='ins_losses'>

it is a positive correlation, meaning that regions with higher insurance premiums tend to have higher insurance losses.

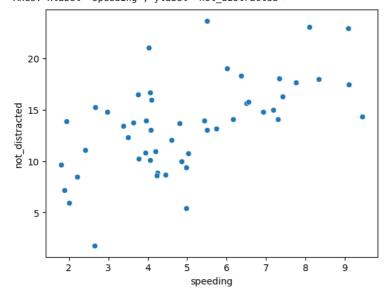

sns.scatterplot(x="not_distracted",y="no_previous",data=df)

<Axes: xlabel='not_distracted', ylabel='no_previous'> 20

it is a positive correlation, meaning that regions with a higher percentage of not distracted accidents tend to have a higher percentage of accidents involving drivers with no previous accidents.

sns.scatterplot(x="speeding",y="not_distracted",data=df)

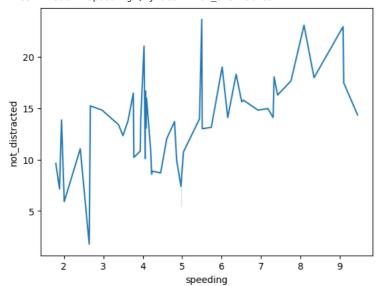

<Axes: xlabel='speeding', ylabel='not_distracted'>

it is a partial positive correlation, meaning that regions with a higher percentage of accidents maybe related to speeding tend to have a higher percentage of accidents where drivers were not distracted.

sns.lineplot(x="speeding",y="not_distracted",data=df)

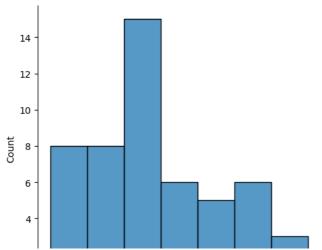

<Axes: xlabel='speeding', ylabel='not_distracted'>

The percentage of accidents where drivers were not distracted increases, the percentage of accidents related to speeding also tends to increase. This indicates a positive relationship.

sns.displot(df["speeding"])

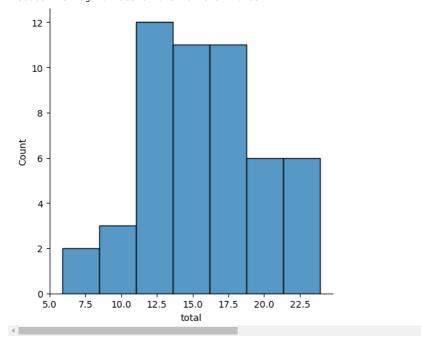

<seaborn.axisgrid.FacetGrid at 0x7b2877d17c70>

This shows distribution of speeding. A sudden rise at level 4-5 can be seen

sns.displot(df["total"])

 $\verb|C:\Users\ayanp\AppData\Roaming\Python\Python310\site-packages\seaborn\axisg| \\$ self._figure.tight_layout(*args, **kwargs) <seaborn.axisgrid.FacetGrid at 0x2626f110160>

This shows that count is very less for lower values of total and it increases later

sns.relplot(x="speeding",y="alcohol",data=df,hue="no_previous")

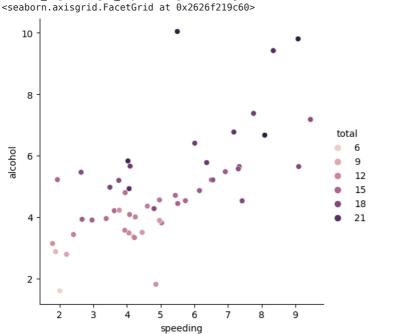

C:\Users\ayanp\AppData\Roaming\Python\Python310\site-packages\seaborn\axisg self._figure.tight_layout(*args, **kwargs) <seaborn.axisgrid.FacetGrid at 0x2626f056c20>

This show positive correlation between alcohol, speeding and no_previous.,

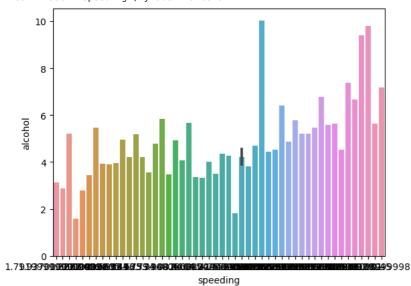

sns.relplot(x="speeding",y="alcohol",data=df,hue="total")

 $C: \Users<table-cell> \ayanp\AppData\Roaming\Python\Python310\site-packages\seaborn\axisg self._figure.tight_layout(*args, **kwargs)$
